Deliverable #: LAB2/Relational Schema

Data Management Course
UM6P College of Computing

Professor: Karima Echihabi **Program:** Computer Engineering
Session: Fall 2026

Team Information

Team Name	PRINT("MySQL")
Member 1	YASSINE OUSSAMA
Member 2	SABER Abdelillah
Member 3	TIGAMI Imran
Member 4	OUAHIDE Soufiane
Repository Link	github.com/abdelillahsaber/DatabaseGroupCC

1 Role of Each Team Member

After the team transformed the ER Diagram provided in the 'LAB 1 Solution Support' into its corresponding relational schema, we divided the remaining tasks as follows:

- **Oussama & Soufiane:** Set up the LaTeX template, drafted the content, and finalized the report formatting.
- **Imran & Abdelillah:** Polished the SQL code, verifying naming conventions, attributes, and constraints.

2 Key Challenges Faced & How They Were Addressed

We encountered only minor challenges during this lab:

- **Merging:** Because each team member worked on a separate section, merging the final code was challenging due to inconsistent naming conventions. We resolved this by standardizing our naming rules before the final review.
- **Overleaf:** This was our first time using LaTeX and Overleaf to collaborate and write an academic report.

3 Conversion Choices

- **Aggregation:** The 'Reservation' entity is in a many-to-many relationship with 'Stocks', which itself is identified by a composite key of two attributes. To resolve this, we defined the primary key of the 'Consumes' table as a composite key comprising three foreign key columns (the two from Stocks and the one from Reservation).
- **Weak Entities:** Initially, we made the mistake of linking the same key twice, once for identifying the weak entity, and once the 'HasMaint' relationship, thinking that they were 2 different things.

4 Assumptions

- We assumed that the ENUM data types are managed externally by the user or the application layer, rather than strictly constrained within the database schema itself.
